TP1 - Conclusion

Numerical data: handle the missing values (for example with the median), then scale the features (StandardScaler, MinMaxScaler, RobustScaler...) depending on the algorithm.

Categorical data: handle the missing values (most frequent value), then encode them: one-hot encoding for nominal features, and ordinal encoding only when there is a real order.

Text data: read it with the right encoding (UTF-8), inspect the documents, the labels and the lengths, then convert the text to numbers before using it in a model.

In all cases, we work on copies, we split the data before preprocessing, and we fit the preprocessing steps on the training set only, to avoid data leakage.
