TP1 - Exercise 2: Answers

Q4. Number of documents and labels

The number of documents is the number of texts in the training subset (one text = one message from a newsgroup). The target array has one label per document, so it has the same length as the list of documents. Each label tells which newsgroup the document belongs to.

Q6. Numeric targets and class names

target_names is a list of the 20 class names. A numeric target value is the index of the class in this list: a label k corresponds to target_names[k]. For example, the label of the first document gives its class name with target_names[target[0]].
